

Visual Insights Report

Dataset 1: Netflix Movies & TV Shows

Key Observations:

- Most Netflix content has been released after 2010.
- Movies form the majority compared to TV Shows.
- The United States contributes the highest number of titles.
- India is the second-largest contributor of content.
- Older titles appear as outliers in the release year distribution.
- Netflix frequently adds newly released content soon after production.
- Monthly additions show no strong seasonal pattern.
- Important features for prediction:
 - Type
 - Country
 - Release Year
 - Rating
 - Genre
 - Added Year

Dataset 2: Iris Dataset

Key Observations:

- The dataset is perfectly balanced across all species.
- Petal Length and Petal Width show strong positive correlation.
- Sepal Width has weak or negative correlation with other features.
- Petal features clearly separate Iris-setosa from other species.
- Only minor outliers appear in Sepal Width.
- Petal dimensions are the most important predictive features.

Overall Conclusion

- EDA helps identify patterns, relationships, and important predictive features.
- Visual analysis confirms dataset quality and separability.
- Netflix dataset highlights content growth trends and country dominance.
- Iris dataset demonstrates clear feature relationships useful for classification.
